

Experiment 11:

Write a program for the task of Credit Score Classification

Python Code:

```
import numpy as np

from sklearn.linear_model import LogisticRegression

X = np.array([[30000,1],[40000,2],[50000,3],
              [60000,4],[70000,5],[80000,6]])

y = np.array([0,0,0,1,1,1])

model = LogisticRegression()

model.fit(X, y)

result = model.predict([[55000,4]])[0]

print("Dataset:")

print("Income History Class")

for i in range(len(X)):
    print(X[i,0], " ", X[i,1], " ", "Good" if y[i] == 1 else "Poor")

print("\nPredicted Credit Score Class:", result)

print("Classification:", "Good Credit" if result == 1 else "Poor Credit")
```

Output:

Dataset:

Income	History	Class
30000	1	Poor
40000	2	Poor
50000	3	Poor
60000	4	Good
70000	5	Good
80000	6	Good

Predicted Credit Score Class: 1
Classification: Good Credit
